ALLOWANCE

Claims 1, 3, 4, 6-8, 10, 12-15 and 19-21 are allowed.

The following is an examiner's statement of reasons for allowance:

Regarding claim 1, prior art of record is silent to teaching a method for efficiently utilizing spectrum resources, comprising:

determining multiple spectrum opportunities, wherein each opportunity is identified by a frequency range and a time duration;

determining whether signals are present in said identified frequency range, wherein if the signals are present, then analyzing said signals and determining the characteristics of said signals;

if the signals are not present in said identified frequency range, then transmitting desired signals using fixed operating conditions;

wherein if the signals are present in said identified frequency range, then

determining a set of altered transmission characteristics based on the determined signal characteristics to allow for transmission of a desired signal in said identified frequency range, wherein said altered transmission characteristics avoid interference with signals expected in said frequency range; and

transmitting said desired signal over the multiple spectrum opportunities simultaneously using said altered transmission characteristics when said transmission occurs during said time duration;

wherein said determining multiple at least one spectrum opportunities opportunity comprises:

determining a location of a receiving device;

obtaining location and transmission characteristics for known transmitters from at least one database; and

determining an estimated received signal characteristics based on the location and transmission characteristics of said transmitters and a location of said receiving device.

Regarding claim 8, prior art of record is silent to teaching a device for effectively utilizing frequency spectrum resources, comprising:

a memory;

a receiving unit for receiving signals and providing received signal characteristics to a processor;

said processor, in communication with said memory, executing code for: receiving information items regarding multiple spectrum opportunities, wherein each opportunity is identified by a frequency range and a time duration;

determining whether signals are present in said identified frequency range, wherein if the signals are present, then analyzing said signals and determining the characteristics of said signals;

if the signals are not present in said identified frequency range, then transmitting desired signals using fixed operating conditions;

wherein if the signals are present in said identified frequency range, then

determining a set of altered transmission characteristics based on the determined signal characteristics to allow for transmission of a desired signal in said identified frequency range, wherein said altered transmission characteristics avoid interference with signals expected in said frequency range;

enabling transmission of said desired signal over the multiple spectrum opportunities simultaneously using said altered transmission characteristics when transmission of said desired signal occurs during said time duration; and

determining said multiple spectrum opportunities information items based on location and transmitting characteristics of known transmitting signals stored in a database and a location of said device.

Regarding claim 15, prior art of record is silent to teaching a wireless communication system, comprising:

a receiving unit for receiving information items regarding at least one receivable signal;

a processing unit for determining multiple spectrum opportunities, wherein each opportunity is identified by a frequency range and a time duration, and for determining whether signals are present in said identified frequency range,

wherein if the signals are present, then analyzing said signals and determining the characteristics of said signals;

a managing unit for altering, if the signals are present in said identified frequency range, transmission characteristics of a desired signal based on said at least one spectrum opportunity and said determined received signal characteristics,

wherein said altered transmission characteristics avoid interference with said received signals; and

a transmission unit receiving said altered transmission characteristics to transmit said desired signal over the multiple spectrum opportunities simultaneously using said altered transmission characteristics, and if no signals are present in said identified frequency range said transmission unit is arranged to send desired signals using fixed operating conditions, wherein said receiving unit includes a processor for receiving information associated with location and transmission characteristics of known transmitting signals and said information items are determined from said location and transmission characteristics of said known transmitting signals.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
